SHORTENED STATUTORY PERIOD OF RESPONSE			MAIL DATE	DELIVERY MODE
3 MONTHS			12/29/2006	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

**Office Action Summary**

Application No.

09/751,372

Applicant(s)

JARVIS ET AL.

Examiner

Aimee J. Li

Art Unit

2183

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 03 October 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-29 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-29 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**DETAILED ACTION**

1. Claims 1-29 have been considered.

***Papers Submitted***

2. It is hereby acknowledged that the following papers have been received and placed of record in the file: Amendment as received 03 October 2006.

***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Greenley, U.S. Patent No. 5,761,469 (herein referred to as Greenley) in view of Hannah et al., U.S. Patent Number 5,706,481 (herein referred to as Hannah).

5. Regarding claims 1, 14, 23, and 29, taking claim 14 as exemplary, Greenley has taught a processing system comprising:

- a. A data processor (Greenley 100 of Fig.1) comprising:
  - i. An instruction execution pipeline comprising N processing stages, each of said N processing stages capable of performing one of a plurality of execution steps associated with a pending instruction being executed by said instruction execution pipeline (Greenley Col.1 lines 34-40);
  - ii. A data cache (Greenley 180 of Fig.1) capable of storing data values used by said pending instruction (Greenley Col.1 lines 42-43);

- iii. A plurality of registers (150 of Fig.1) capable of receiving said data values from said data cache (Greenley Col.1 lines 41-45);
  - iv. A load store unit (Greenley 130 of Fig.1) capable of transferring a first one of said data values from said data cache to a target one of said plurality of registers during execution of a load operation (Greenley Col.1 lines 15-21, 63-67 and Col.2 lines 1-7, 13-15);
  - v. A shifter circuit (Greenley 160,170 of Fig.1) associated with said load store unit capable of one of a) shifting (Greenley Col.2 lines 19-31), b) sign extending (Greenley Col.2 lines 48-54), and c) zero extending (Greenley Col.2 lines 45-47) said first data value prior to loading said first data value into said target register;
  - b. A memory coupled to said data processor (Greenley Col.1 lines 41-43); and
  - c. A plurality of memory-mapped peripheral circuits coupled to said data processor for performing selected functions in association with said data processor (Greenley Col. 1 line 29 to Col. 2 line 7 and Col. 2 lines 16-31). In regards to Greenley, the ICACHE, prefetch unit, and memory subsystems perform selected functions, such as storing instructions, fetching instructions from selected locations, accessing words in memory, at and from certain locations from memory.
6. Greenley has not explicitly taught bypass circuitry associated with said load store unit capable of transferring said first data value from said data cache directly to said target register without processing said first data value in said shifter circuit. However, Greenley has taught a

sign extension unit (Greenley 160 of Fig.1) that performs a function to fill in unoccupied bits of a register by extending its sign after it is loaded from the data cache but before it is stored in the register file (Greenley Col.2 lines 48-50). Hannah has taught bypassing functions circuitry capable of transferring said first data value to said target without processing said first data value in said shifter circuit (Hannah column 9, lines 31-67; Figure 11; Figure 12; Figure 13; and Figure 14). A person of ordinary skill in the art at the time the invention was made would have recognized that bypasses improve the performance of a system by minimizing delays from unnecessary functions (Hannah column 9, lines 38-44). Therefore, it would have been obvious to a person of ordinary skill in the art at the time was made to incorporate the bypassing of Hannah in the device of Greenley to improve system performance.

7. Claim 14 is nearly identical to claims 1, 23, and 29. Claim 1 differs from claim 14 in its lack of a main memory and memory-mapped peripheral circuits, but comprises the same data processor as claim 14, and is therefore rejected for the same reasons. Claim 23 differs in that it lacks the load store unit and pipeline limitations, but the rest of the limitations are similar to claim 14, and is therefore rejected for the same reasons. Claim 29 differs in that it lacks the load store unit and pipeline limitations but has memory and memory-mapped peripheral circuits, similar to claim 14, but the rest of the limitations are similar, and is therefore rejected for the same reasons.

8. Regarding claims 2 and 15, taking claim 15 as exemplary, Greenley in view of Hannah has taught the processing system as set forth in claim 14, wherein said bypass circuitry transfers said first data value from said data cache directly to said target register during a load word operation (see above rejection of claim 1). While Greenley has taught a different register size

than the applicant (Greenley Col.2 lines 17-19), the situation when a register has no unoccupied bits after being loaded with data from a data cache remains the same, with the size of the register and word being moot. Therefore Greenley's loading of a double word has the same consequences as the applicant's loading of a word.

9. Claim 2 is nearly identical to claim 15. Claim 2 differs in its parent claim, but comprises the same data processor as claim 15, and is therefore rejected for the same reasons.

10. Regarding claims 3 and 16, taking claim 16 as exemplary, Greenley in view of Hannah has taught the data processor as set forth in claim 15, wherein said bypass circuitry (Hannah column 9, lines 31-67; Figure 11; Figure 12; Figure 13; and Figure 14) transfers said first data value from said data cache directly to said target register at the end of two machine cycles (Greenley Col.4 lines 17-20).

11. Claim 3 is nearly identical to claim 16. Claim 3 differs in its parent claim, but comprises the same data processor as claim 16, and is therefore rejected for the same reasons.

12. Regarding claims 4 and 17, taking claim 17 as exemplary, Greenley in view of Hannah has taught the data processor as set forth in claim 14, wherein said shifter circuit one of a) shifts, b) sign extends, or c) zero extends said first data value prior to loading said first data value into said target register during a load half-word operation (see Greenley Col.2 lines 17-20, 24-30, 46-47).

13. Claim 4 is nearly identical to claim 17. Claim 4 differs in its parent claim, but comprises the same data processor as claim 17, and is therefore rejected for the same reasons.

14. Regarding claims 5 and 18, taking claim 18 as exemplary, Greenley in view of Hannah has taught the data processor as set forth in claim 17, wherein said shifter circuit loads said

Art Unit: 2183

shifted first data value into said target register at the end of two machine cycles (Greenley Col.4 lines 17-20), but has not explicitly taught the load taking three machine cycles. However, Greenley has taught this two-cycle latency for all load instructions, including those without the need for sign extension. In the situation where the load instruction fills the target register completely and no sign extension is needed, such as when the data is already properly aligned since it is coming from the data cache, which only contains aligned data, or from the ALU, which outputs aligned data, the data processor as configured above will execute the load instruction at least one cycle faster due to the elimination of the shifter operations. This will create a latency of at least one cycle fewer for those load instructions which bypass the sign extension unit, and at least one more cycle for those which need sign extension, such as half-word load instructions. Because the applicant's claimed load instructions, which take 2 and 3 cycles for bypassed and sign-extended instructions, respectively, have no claimed advantages over the 1 and 2 cycles that Greenley in view of Hannah have taught, but are merely a change in the magnitude of latency, they are considered to be equivalent and thus taught by Greenley in view of Hannah (see *In re Rose*, 220 F.2d 459, 463, 105 USPQ 237, 240 (CCPA 1955)).

15. Claim 5 is nearly identical to claim 18. Claim 5 differs in its parent claim, but comprises the same data processor as claim 18, and is therefore rejected for the same reasons.

16. Regarding claims 6 and 19, taking claim 19 as exemplary, Greenley in view of Hannah has taught the data processor as set forth in claim 14, wherein said shifter circuit one of a) shifts, b) sign extends, and c) zero extends said first data value prior to loading said first data value into said target register during a load byte operation (see Greenley Col.2 lines 17-20, 36-40, 46-47).

Art Unit: 2183

17. Claim 6 is nearly identical to claim 19. Claim 6 differs in its parent claim, but comprises the same data processor as claim 19, and is therefore rejected for the same reasons.

18. Regarding claims 7 and 20, taking claim 20 as exemplary, Greenley in view of Hannah has taught the data processor as set forth in claim 6, wherein said shifter circuit loads said shifted first data value into said target register at the end of two machine cycles (Greenley Col.4 lines 17-20), but has not explicitly taught the transfer taking three machine cycles. However, Greenley has taught this two-cycle latency for all load instructions, including those without the need for sign extension. In the situation where the load instruction fills the target register completely and no sign extension is needed, such as when the data is already properly aligned since it is coming from the data cache, which only contains aligned data, or from the ALU, which outputs aligned data, the data processor as configured above will execute the load instruction at least one cycle faster due to the elimination of the shifter operations. This will create a latency of at least one cycle fewer for those load instructions which bypass the sign extension unit, and at least one more cycle for those which need sign extension, such as half-word load instructions. Because the applicant's claimed load instructions, which take 2 and 3 cycles for bypassed and sign-extended instructions, respectively, have no claimed advantages over the 1 and 2 cycles that Greenley in view of Hannah have taught, but are merely a change in the magnitude of latency, they are considered to be equivalent and thus taught by Greenley in view of Hannah (see *In re Rose*, 220 F.2d 459, 463, 105 USPQ 237, 240 (CCPA 1955)).

19. Claim 7 is nearly identical to claim 20. Claim 7 differs in its parent claim, but comprises the same data processor as claim 20, and is therefore rejected for the same reasons.

Art Unit: 2183

20. Regarding claims 8, 9, 21, and 22, taking claims 21 and 22 as exemplary, Greenley in view of Hannah has taught the data processor as set forth in claim 14, but Greenley has not explicitly taught

- a. Wherein said bypass circuitry comprises a multiplexer having a first input channel coupled to a data output of said data cache; and
- b. Wherein said multiplexer has a second input channel coupled to an output of said shifter circuit.

21. However, Greenley has taught a sign extension unit (Greenley 160 of Fig.1) that fills in unoccupied bits of a register by extending its sign after it is loaded from the data cache but before reaching a register in the register file (Greenley Col.2 lines 48-50). Hannah has taught

- a. Wherein said bypass circuitry comprises a multiplexer having a first input channel (Hannah column 9, lines 31-67; Figure 11; Figure 12; Figure 13; and Figure 14); and
- b. Wherein said multiplexer has a second input channel coupled to an output of another device (Hannah column 9, lines 31-67; Figure 11; Figure 12; Figure 13; and Figure 14).

22. A person of ordinary skill in the art at the time the invention was made would have recognized that bypasses improve the performance of a system by minimizing delays from unnecessary functions (Hannah column 9, lines 38-44). Therefore, it would have been obvious to a person of ordinary skill in the art at the time was made to incorporate the bypassing of Hannah in the device of Greenley to improve system performance.

Art Unit: 2183

23. Claims 8 and 9 are nearly identical to claims 21 and 22 respectively. Claims 8 and 9 differ in its parent claim, but comprises the same data processor as claims 21 and 22, and is therefore rejected for the same reasons.

24. Regarding claim 10, Greenley has taught for use in a processor comprising an N-stage execution pipeline (Greenley Col.1 lines 34-40), a data cache (Greenley 180 of Fig.1), and a plurality of registers (Greenley 150 of Fig.1), a method of loading a first data value from the data cache into a target one of the registers, the method comprising the steps of:

- a. Determining if a pending instruction in the execution pipeline is one of a load word operation, a load half-word operation, and a load byte operation (Greenley Col.1 lines 63-67, Col.2 lines 1-7, 17-19 and Col.5 lines 13-24).
- b. In response to a determination that the pending instruction is a load half-word operation, transferring the first data value from the data cache to a shifter circuit and shifting the first data value prior to loading the first data value into the target register (Greenley Col.2 lines 24-31).
- c. In response to a determination that the pending instruction is a load byte operation, transferring the first data value from the data cache to a shifter circuit and shifting the first data value prior to loading the first data value into the target register (Greenley Col.2 lines 35-40).

25. Greenley has not explicitly taught where in response to a determination that the pending instruction is a load word operation, transferring the first data value from the data cache directly to the target register without processing the first data value in the shifter circuit. However, Greenley has taught a sign extension unit (Greenley 160 of Fig.1) that fills in unoccupied bits of

a register by extending its sign after it is loaded from the data cache but before it is stored in a certain register in the register file (Greenley Col.2 lines 48-50). Hannah has taught bypassing sign extension (Hannah column 9, lines 31-67; Figure 11; Figure 12; Figure 13; and Figure 14).

A person of ordinary skill in the art at the time the invention was made would have recognized that bypasses improve the performance of a system by minimizing delays from unnecessary functions (Hannah column 9, lines 38-44). Therefore, it would have been obvious to a person of ordinary skill in the art at the time was made to incorporate the bypassing of Hannah in the device of Greenley to improve system performance.

26. Regarding claim 11, Greenley in view of Hannah has taught the method as set forth in claim 10, wherein the step of transferring the first data value requires two machine cycles during a load word operation (Greenley Col.4 lines 17-20). While Greenley has taught a different register size than the applicant (Greenley Col.2 lines 17-19), the situation when a register has no unoccupied bits after being loaded with data from a data cache remains the same, with the size of the register and word being moot. Therefore Greenley's loading of a double word has the same consequences as the applicant's loading of a word (*In re Rose*, 220 F.2d 459, 463, 105 USPQ 237, 240 (CCPA 1955)).

27. Regarding claim 12, Greenley in view of Hannah has taught the method as set forth in claim 10, wherein the step of transferring the first data value requires two machine cycles during a load half-word operation (Greenley Col.4 lines 17-20), but has not explicitly taught the transfer taking three machine cycles. However, Greenley has taught this two-cycle latency for all load instructions, including those without the need for sign extension. In the situation where the load instruction fills the target register completely and no sign extension is needed, such as when the

data is already properly aligned since it is coming from the data cache, which only contains aligned data, or from the ALU, which outputs aligned data, the data processor as configured above will execute the load instruction at least one cycle faster due to the elimination of the shifter operations. This will create a latency of at least one cycle fewer for those load instructions which bypass the sign extension unit, and at least one more cycle for those which need sign extension, such as half-word load instructions. Because the applicant's claimed load instructions, which take 2 and 3 cycles for bypassed and sign-extended instructions, respectively, have no claimed advantages over the 1 and 2 cycles that Greenley in view of Hannah have taught, but are merely a change in the magnitude of latency, they are considered to be equivalent and thus taught by Greenley in view of Hannah (see *In re Rose*, 220 F.2d 459, 463, 105 USPQ 237, 240 (CCPA 1955)).

28. Regarding claim 13, Greenley in view of Hannah has taught the method as set forth in claim 10 wherein the step of transferring the first data value requires two machine cycles during a load byte operation (Greenley Col.4 lines 17-20), but has not explicitly taught the transfer taking three machine cycles. However, Greenley has taught this two-cycle latency for all load instructions, including those without the need for sign extension. In the situation where the load instruction fills the target register completely and no sign extension is needed, such as when the data is already properly aligned since it is coming from the data cache, which only contains aligned data, or from the ALU, which outputs aligned data, the data processor as configured above will execute the load instruction at least one cycle faster due to the elimination of the shifter operations. This will create a latency of at least one cycle fewer for those load instructions which bypass the sign extension unit, and at least one more cycle for those which

Art Unit: 2183

need sign extension, such as half-word load instructions. Because the applicant's claimed load instructions, which take 2 and 3 cycles for bypassed and sign-extended instructions, respectively, have no claimed advantages over the 1 and 2 cycles that Greenley in view of Hannah have taught, but are merely a change in the magnitude of latency, they are considered to be equivalent and thus taught by Greenley in view of Hannah (see *In re Rose*, 220 F.2d 459, 463, 105 USPQ 237, 240 (CCPA 1955)).

29. Referring to claim 24, Greenley in view of Hannah has taught

- a. The data value is transferred from the cache to the target register via the bypass circuit (see above rejection of claim 1). While Greenley has taught a different register size than the applicant (Greenley Col.2 lines 17-19), the situation when a register has no unoccupied bits after being loaded with data from a data cache remains the same, with the size of the register and word being moot. Therefore Greenley's loading of a double word has the same consequences as the applicant's loading of a word.
- b. The data value is transferred from the cache to the target register via the shifter circuit during a load half-word operation or a load byte operation (see Greenley Col.2 lines 17-20, 24-30, 46-47).

30. Referring to claim 25, Greenley in view of Hannah has taught

- a. The bypass circuit (Hannah column 9, lines 31-67; Figure 11; Figure 12; Figure 13; and Figure 14) is capable of transferring the data value from the cache to the target register at an end of two machine cycles (Greenley Col.4 lines 17-20); and

- b. The shifter circuit is capable of providing the modified data value to the target register at an end of three machine cycles (Greenley Col.4 lines 17-20), but has not explicitly taught the load taking three machine cycles. However, Greenley has taught this two-cycle latency for all load instructions, including those without the need for sign extension. In the situation where the load instruction fills the target register completely and no sign extension is needed, such as when the data is already properly aligned since it is coming from the data cache, which only contains aligned data, or from the ALU, which outputs aligned data, the data processor as configured above will execute the load instruction at least one cycle faster due to the elimination of the shifter operations. This will create a latency of at least one cycle fewer for those load instructions which bypass the sign extension unit, and at least one more cycle for those which need sign extension, such as half-word load instructions. Because the applicant's claimed load instructions, which take 2 and 3 cycles for bypassed and sign-extended instructions, respectively, have no claimed advantages over the 1 and 2 cycles that Greenley in view of Hannah have taught, but are merely a change in the magnitude of latency, they are considered to be equivalent and thus taught by Greenley in view of Hannah (see *In re Rose*, 220 F.2d 459, 463, 105 USPQ 237, 240 (CCPA 1955)).

31. Referring to claim 26, Greenley in view of Hannah has taught wherein the bypass circuit comprises a multiplexer having a first input coupled to the cache and a second input coupled to

Art Unit: 2183

the shifter circuit (Hannah column 9, lines 31-67; Figure 11; Figure 12; Figure 13; and Figure 14).

32. Referring to claim 27, Greenley in view of Hannah has taught

- a. Shifting, sign extending, or zero extending a first data value from a cache and providing a modified first data value to a first of a plurality of registers (Greenley Col.1 lines 15-21, 63-67 and Col.2 lines 1-7, 13-15, and 19-54); and
- b. Transferring a second data value from the cache to a second of the plurality of registers without shifting, sign extending, or zero extending the second data value (Greenley Col.1 lines 15-21, 63-67 and Col.2 lines 1-7, 13-15, and 19-54).

33. Referring to claim 28, Greenley in view of Hannah has taught

- a. Shifting, sign extending, or zero extending the first data value comprises shifting, sign extending, or zero extending the first data value in response to determining that a first pending instruction in a processor is a load byte operation or a load half-word operation (see Greenley Col.2 lines 17-20, 24-30, 46-47); and
- b. Transferring the second data value comprises transferring the second data value to the second register in response to determining that a second pending instruction in the processor is a load word operation (see Greenley Col.2 lines 17-20, 24-30, 46-47).

#### ***Response to Arguments***

34. Applicant's arguments filed 03 October 2006 have been fully considered but they are not persuasive. Applicant has argued in essence on pages 11-12

...no cited reference or combinations of references discloses, teaches, or suggests a structure where a data value can either be (i) transferred from a data cache to a target through a shifter circuit, or (ii) directly transferred from the data cache to the target register (while bypassing the shifter circuit).

35. This has not been found persuasive. The claim language defines “a shifter circuit” as a circuit that can shift, sign extend, **or** zero extend. The claim language is in the alternative, so the Examiner only needs to show that **one** of the listed functionalities is present to meet the claim requirements. As shown in the rejection above, Greenley in column 2, lines 19-54 and Figure 1 has taught circuits that perform shifting, sign extending, **and** zero extending on data from a data cache prior to the data being stored in a target register, even though only one of the functionalities is required to meet the claim limitations. However, as Greenley has taught in column 1, lines 29-31 that data from the cache **may be** sign extended and further explains what to do **when** the data is sign extended. However, Greenley does not discuss in detail what happens when the data is **not** sign extended. Hannah states in column 9, lines 53-58 that “Since each slice handles both a sign bit and its extension, as well as fraction bits, these capabilities are **disabled or bypassed** as appropriate for the position of the slice in the larger word.” Hannah also teaches in column 9, lines 37-44 that his implementation of the multiplexers he minimizes gate count, e.g. reduce the physical size of the device, and attains “flexibility in data width.” Hannah then proceeds to state that “In some applications, greater precision and resolution are desirable, whereas, in other applications, speed and cost are of greater importance.” This suggests that how the multiplexers are used, e.g. to bypass certain capabilities, dependent on the designers desire. Bypassing effectively disables a functionality, such as the sign extension

Art Unit: 2183

mentioned in both Greenley and Hannah, so that it is not performed and time is not wasted on an unneeded functionality. Consequently, the speed is increased in the system.

*Conclusion*

36. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

37. A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

38. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Aimee J. Li whose telephone number is (571) 272-4169. The examiner can normally be reached on M-T 7:00am-4:30pm.

39. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Eddie Chan can be reached on (571) 272-4162. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

40. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

Art Unit: 2183

applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
